

Design choices

- Title, text and graphics with a padding left and right and the footer full page, because it looks nice.
- Text above the graphics give general information, so that the user knows what the graphics are about. Three columns because it are three subjects and it looks less in columns than in paragraphs underneath each other.
- Title and subtitle normal and titles of the information parts in capitals, because it looks nice and it makes it clear what the paragraphs are about.
- Bar chart: simple colours, text on x-axis is wrapped and rotated so that it is clear what is what. When someone moves over the bar the tree is updated.
- Tree: colour matches the colours from the bar chart. Text under the tree is needed for clarity (to interpret the percentages). Dot size of the leaves change according to the percentages (relative to the whole data set of that year and not a specific SEC kind that is why the domain is set in functionsBarChart.js instead of fuctionsTree.js).
- Bar chart left and tree right because people read from left to right and the bar chart has to come first.
